The 4-year derived dropout rate is an estimate of the percent of students who would drop out in a four year period based on data collected for a single year. To create an actual 4-year rate CDE would need to collect individual student data and be able to track such data over time.

4 Year Derived Rate Formula: $(1 - ((1 - (\text{drop gr 9} / \text{enroll gr 9})) * (1 - (\text{drop gr 10} / \text{enroll gr 10}))) * (1 - (\text{drop gr 11} / \text{enroll gr 11})) * (1 - (\text{drop gr 12} / \text{enroll gr 12})))) * 100$
